

Project of the Year 2005: Nominated Project

I-74 / Peoria Intelligent Transportation System

As the largest road construction project in Illinois outside the Chicago area, the 12-mile reconstruction of I-74 posed unique challenges for the Cities of Peoria and East Peoria. ITS technologies and strategies were planned, designed, and implemented to enhance the operations and management efficiency of the corridor, both during and after construction. Beginning with the development of the I-74 ITS Project System Architecture in 2001, an integrated system was developed to promote the sharing of transportation data between partner agencies. The result is an intelligent transportation system for the region that helps to provide safer, more efficient movement of travelers, goods, and services in the I-74 corridor.
